

MOBILE ALARMS

The ATT Alarm System has been designed to work with mobile workplaces. Employees who are not attached to a particular location generally use a mobile device. The ATT Alarm System provides information at all times about alarms or irregularities, so employees can react to various events immediately via the ATT Alarm-APP.

THE BENEFITS OF THE MOBILE ALARM SYSTEM

Many workplaces are no longer bound to a particular location and demand flexibility. The ATT Alarm System is not only designed to work with PC workplaces, but also on mobile devices. Therefore ATT Alarm-APP users receive information about every event and can react immediately via smartphone to initiate further measures. Every event is conveyed to the app without delay by means of push technology and can be acknowledged or dealt with in real time.

The app offers a range of ring tones to choose from for different kind of events. At the same time the app conserves battery life, since notifications only appear if an event occurs. If no internet connection is available, the notifications are automatically sent via text message. The ATT Alarm-APP is available for the following systems: IOS, Android, Windows PC, tablets.

MOBILE SAFETY IN CRITICAL SITUATIONS

Employees working in a range of sectors can be exposed to different kinds of risks: threats posed by customers, terror attacks, accidents at work, vandalism, vehicle breakdowns or traffic accidents are some examples of potential threats or critical situations. The ATT Alarm-APP means an alarm can be triggered at any time.
